Introduce and encapsulate nature of E20:20V project:

1. **To promote the electrification of standard i.c.e. vehicles.** Make the case for the number of immediate jobs this would create and opportunity for mechanics and repair garages to transition to the new eV technologies, by offering conversion service, combining forces to bulk-buy components through local, regional and national consortia of independent individuals and small firms.
2. **To promote installation of solar on every suitable roof**, and addition of car charging port(s) as a step towards facilitating the migration to converted EVs, making it easier for people to save a great deal, by charging directly off their own solar array - possibly at night, using an intermediate storage battery for this purpose.
3. **Advance the case for an Intermediate Hydrogen Economy**, - while we still advancing R&D for Nuclear Fusion - to help the workforce of Fossil Fuel refineries find alternative jobs in the production by renewables, refining, storage, transportation and distribution of H₂, as the safety features have some similarities, especially with Natural Gas.
5. **Call for participants to disseminate to their most trusted contacts**, asking them to widen the net, and invite technologists to wade in with their support for concrete, tangible action, funding and urgent calls for papers from academia, aimed at suggesting solutions, not just flagging obstacles! Celebrities are useful also, to back, underwrite and pledge their financial contributions to selected projects. Especially if we can convince some to go ahead with conversion of their car conversion to EVs
